Compact Hot Water Distribution Systems for R406.3 additional energy credit.

For this proposal, utilizing the language in separately submitted “Short Water Volume Determination” proposal, our team expanded the analysis and performed LCC savings and Simple Paybacks. This proposal was found to have net positive savings for all scenarios with the 16-ounce or 1 pint language as proposed.

This analysis was done to introduce a new potential energy efficiency measure for section R406 and Table R406.3 that aligns with savings already included in section R405 for simulated performance.

This proposal recognizes that for this measure to be both effective and efficient, a useful hot water temperature of at least 105°F must be achieved in reasonable time at the tap. The analysis used savings estimates for this scenario.

Proposed code change text: (Copy the existing text from the Integrated Draft, linked above, and then use underline for new text and strikeout for text to be deleted.)

<td>5.6</td>
<td>Not greater than 16 ounces of water volume shall be stored in the piping between the hot water source and any hot water fixture when calculated in accordance with Section R403.5.4.</td>
<td>0.5</td>
<td>N/A</td>
</tr>
</tbody>
</table>

One of the following checks must be done to verify that the system meets the prescribed limit:

1. At plan review, by referencing ounces of water per foot of tube on plans per Table R403.5.4.1.
2. At rough in (plumbing), by referencing ounces of water per foot of tube installed per Table R403.5.4.1.
3. At final inspection, in accordance with Department of Energy’s Zero Energy Ready Home National Specification (Rev. 07 or higher) footnote on Hot water delivery systems.

For Compact Hot Water Distribution system credit, the volume shall store not more than 16 ounces of water between the nearest source of heated water and the termination of the fixture supply pipe where calculated using section
### Purpose of code change:

Inefficient hot water distribution systems have been recognized as a problem for many years as they result in energy and water waste, and result in long hot water delay times that are the cause of a considerable number of complaints by new home buyers. Recirculation systems are a solution to two of the three problems (water and wait time), but the thermal energy impact of different recirculation system options has already been addressed in section R403.5.1.1 Circulation system.¹

In all non-recirculation distribution options, water heater energy consumption and hot water waste are correlated. A decrease in water heater energy consumption follows a reduction in wasted water; therefore, improving insulation and reducing the piping length and/or pipe diameter have equal benefits for energy and water waste. In recirculation systems, water heater energy consumption and wasted hot water are independent, and often have an inverse effect (when recirculation is not demand based).²

This distribution system problem exists for a variety of factors including:

- An outdated pipe sizing methodology in the plumbing code that results in oversized hot water distribution systems since the assumed fixture flow rates are much higher than current requirements.

- Municipalities with design recommendations that force plumbers and designers to assume low supply water pressure, resulting in larger distribution piping, which waste more water and energy.

- Increasing efforts to conserve water has resulted in the realization of water savings due to improvements in showerhead and lavatory maximum flow rates; however, reduced flow rates often result in increased wait times if the hot water distribution system is not designed to accommodate lower flows.

- Increasing popularity of gas instantaneous water heaters, which offer improved operating efficiency, but can result in increased water waste when starting from a “cold start up” situation.

- Inefficient plumbing installations that are not focused on minimizing pipe length or pipe diameters.

The WSEC-R has already addressed pipe insulation and Circulation systems in the 2018 WSEC-R prescriptive and Table 406.3 additional energy credits.
Your amendment must meet one of the following criteria. Select at least one:

☐ Addresses a critical life/safety need. ☐ Consistency with state or federal regulations.

☒ The amendment clarifies the intent or application of the code. ☐ Addresses a unique character of the state.

☐ Addresses a specific state policy or statute. ☐ Corrects errors and omissions.

(Note that energy conservation is a state policy)

Check the building types that would be impacted by your code change:

☒ Single family/duplex/townhome ☐ Multi-family 4 + stories ☐ Institutional

☒ Multi-family 1 – 3 stories ☐ Commercial / Retail ☐ Industrial

3 Economic Impact Data Sheet

Is there an economic impact: ☒ Yes ☐ No

Briefly summarize your proposal’s primary economic impacts and benefits to building owners, tenants, and businesses. If you answered “No” above, explain your reasoning.

*The proposal states that this would neither increase nor decrease the cost of construction. Similar to bringing ducts inside the conditioned space, some research has estimated a net cost decrease after design changes due both to labor and materials reductions. For the analysis performed and used in the LCC, we did assume a slight $300 first cost increase to recognize that not all scenarios will have the same cost reduction.*

Provide your best estimate of the construction cost (or cost savings) of your code change proposal? (See OFM Life Cycle Cost Analysis tool and Instructions; use these Inputs. Webinars on the tool can be found Here and Here)

$0.14/square foot (CFA)(For residential projects, also provide $300/ dwelling unit)

Show calculations here, and list sources for costs/savings, or attach backup data pages

Incremental cost findings from the California Energy Commission’s Energy Research and Development Division Final Project Report: Code Changes and Implications of Residential Low-Flow Hot Water Fixtures, September 2021, CEC-500-2021-043 indicate that there may be up to $1,500 cost savings for designing and installing a system with less materials and with greater work efficiency due to reduced plumbing layout. The Codes and Standards Enhancement (CASE) Initiative, Compact Hot Water Distribution – Final Report,
Measure Number: 2019-RES-DHW1-F reported that incremental cost is highly scenario dependent, but overall determined that there would be little to no cost increase.

For the purposes of this analysis, we assumed that while incremental costs are likely to be neither higher, nor lower than standard plumbing designs, a small incremental cost of $300 would cover the bases for an increased number of potential scenarios.

Provide your best estimate of the **annual energy savings** (or additional energy use) for your code change proposal?

$0.05 \text{ KWH/square foot}$ (or) Click here to enter text: $\text{KBTU/square foot}$

(For residential projects, also provide $111.2 \text{ KWH/KBTU} / \text{dwelling unit}$)

Show calculations here, and list sources for energy savings estimates, or attach backup data pages

This analysis focused on kWh and Water Savings as it is estimated that over 80% of Residential New Construction Water Heaters installed are Heat Pump Water Heaters in Washington where many of the savings have already been accepted and analyzed.

**SAVINGS**

The two California assessments found slightly higher energy savings than did modeling in REM/Rate v16.0.6. For the purposes of this assessment, the more conservative REM/Rate values were used.

<td>3c through 5</td>
<td>163.2</td>
<td>16.43</td>
</tr>
</tbody>
</table>

These estimates come from assumption of a 2,430 sq ft home with 3.5 bedrooms.

Considering these varying, but same order of magnitude savings numbers, a savings number has been generated for 1.5 pints or 24 ounces of water, across Washington to be: 106.5 kWh.

**Water Savings**

Estimated impacts on water use are presented in the table below. Water use savings estimates are challenging given that hot water usage behaviors among individuals and households are highly variable and can depend strongly on the demographics of the household (Parker, D.; Fairey, P.; and Lutz, J.; 2015). In addition, the proposed compliance option approach ensures that compliant hot water distribution systems will be smaller than a conventional non-compact system but cannot precisely specify the design and configuration and hence the impacts on water waste. To provide a best approximation of water savings impacts, the Statewide CASE Team in California relied on detailed distribution simulation study completed under the U.S. Department of Energy's Building America program (Weitzel, E.; Hoeschele, M. 2014). In these estimates, it was assumed that all water savings occur indoors.

An average cost of $3/1000 gallons was used to estimate water savings.

In lieu of attempting to convert water savings and costs for water from California to Washington, this analysis has chosen to utilize an embedded energy in wasted water that adds an additional 4.7 kWh/yr.

### Table : Impacts on Water Use

<table>
<thead>
<tr>
<th></th>
<th>Indoor Water Savings (gal/yr)</th>
<th>Embedded Electricity Savings&lt;sup&gt;a&lt;/sup&gt; (kWh/yr)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Per Dwelling Unit Impacts (single family)</td>
<td>962</td>
<td>4.7</td>
</tr>
</tbody>
</table>

<sup>a</sup> Assumes embedded energy factor of 4,848 kWh per million gallons of water (CPUC 2015).

The choice to use a 4.7 kWh/yr adder to electricity savings produced a more conservative LCC calculation that did the option to individually subtract water savings costs independently.

### LCC

Life-cycle costs were calculated using the IECC-Residential LCC Calculator.

A blended annual savings averaged across both climate zones in Washington and averaging savings between both 16- and 32-ounce cases led to the use of **111.2 kWh savings per year**.

Using these energy savings and a $300 first cost, the LCC shows Simple Payback of 17.15 years for LCC with social cost of carbon (SCC) included. The LCC without SCC showed a Simple Payback of 19.66 years.

Measure Incremental LCC in both scenarios were found to be as follows:

### Blended Savings:

All questions must be answered to be considered complete. Incomplete proposals will not be accepted.
List any code enforcement time for additional plan review or inspections that your proposal will require, in hours per permit application:

If confirmed at time of both plan review and inspection, this may require up to 1/2 hour per application per floor plan and ¼ hour per site inspection per home.

**Small Business Impact.** Describe economic impacts to small businesses:

There is not anticipated to be any positive or negative impacts unique to small businesses.

**Housing Affordability.** Describe economic impacts on housing affordability:

Affordable housing typically has a smaller footprint, smaller house size, and is configured with “wet walls” or plumbing locations in close proximity to each other. This increases the likelihood that this credit could be taken by affordable housing projects.

**Other.** Describe other qualitative cost and benefits to owners, to occupants, to the public, to the environment, and to other stakeholders that have not yet been discussed:
